

INTERNAL USE CASES

Sensitive data under your control.

Controlled access and human approval where required, on the internal use cases being deployed first.

WHAT WE KEEP HEARING

Most firms are deploying internally first, across software delivery, operations, HR, IT support, audit and testing. Customer-facing agents tend to remain tightly bounded, with human involvement designed in.

Internal workflows still touch colleague records, transaction populations, investment data and legacy processes. Firms need agents to stay within authorised data and task boundaries, flag missing information rather than fill gaps, and prevent problems before they happen. Failed internal POCs have made them cautious.

WHAT NUGGETS DOES

Nuggets checks authority before an agent accesses or exports data. Each check is bound to the specific agent, delegation and action, so scope is enforced rather than instructed.

Where policy requires a person, the action escalates for human approval. Where policy permits, it proceeds, with the authority decision captured in an Action Receipt.

This preventive control integrates with existing control systems and can be assessed through the approval route you already use.

PILOT SCOPE

An agent attempts a data export beyond its authorised scope. Show the interception, the evaluation and the block before it executes.

OUTCOME

Controlled access to sensitive data.
